Project Title:
Script-Controlled ACL – Restrict Record Access Based on Field Value

1. Brainstorming & Ideation Phase

The project is based on improving record-level security in ServiceNow by restricting access to Institution Details records based on the user's role and the Branch field value. The existing setup may allow users with appropriate table access to view or modify records without applying specific branch-level restrictions. The project idea was developed to provide controlled and secure access to records and prevent unauthorized users from accessing sensitive information.

The main idea is to use **ServiceNow Access Control Lists (ACLs)** with script-controlled conditions to control **Read, Create, Write, and Delete** operations on the **u_institution_details** table. The Read ACL will allow users with the **bb1** role to access records belonging to the **EEE branch**, while administrators will retain full access. Additional roles such as **bb2, bb3, and bb4** will control Create, Write, and Delete operations respectively.

The project user story is: **As a ServiceNow administrator, I want to restrict access to Institution Details records based on user roles and branch values so that only authorized users can view,**

create, modify, and delete records. This is intended to improve record-level security and reduce unauthorized access to institutional data.

The proposed solution focuses on implementing script-controlled ACLs for the **u_institution_details** table, evaluating user roles and record field values before allowing access. The solution will provide controlled access to EEE branch records, ensure that users without the required roles are denied access, and allow administrators to retain complete access to the records. This improves data security, access control, and overall management of records in the ServiceNow platform.
