Project Title:
Script-Controlled ACL – Restrict Record Access Based on Field Value

2. Requirement Analysis Phase

The requirement analysis for the project focuses on implementing record-level security for the Institution Details table in ServiceNow. The main requirement is that access to records should be controlled based on the user's assigned roles and the Branch field value.

The solution must use ServiceNow Access Control Lists (ACLs) with script-controlled conditions. The Read ACL should allow users with the **bb1** role to view only records where the Branch field is set to **EEE**. Administrators should retain full access to all records.

The project must also include separate ACLs for the **Create, Write, and Delete** operations. The Create operation should require the **bb2** role, the Write operation should require the **bb3** role, and the Delete operation should require the **bb4** role. These roles are used together with the Read access requirement to provide controlled access to the records.

The Institution Details table should be created as **u_institution_details** and contain fields such as

Student Roll Number, Student Name, Faculty Name, Branch, Email, Phone Number, and Description. The Branch field should contain the choices **ECE, EEE, and CSE**, allowing the ACL to distinguish records according to their branch.

The expected result is that authorized users can perform only the operations allowed by their roles, EEE users can access the permitted EEE branch records, users without the required roles are denied access, and administrators can view and manage all Institution Details records.
