Project Title:
Script-Controlled ACL – Restrict Record Access Based on Field Value

4. Project Planning Phase

The project planning phase organises the implementation into a sequence of activities that can be completed in ServiceNow. The planned work begins with creating the required test user and roles, followed by creating the Institution Details table and records, configuring the Read, Create, Write, and Delete ACLs, and finally verifying access for different users.

The first planned activity is to open ServiceNow with administrator access, create the EEE User, and create the custom roles **bb1, bb2, bb3, and bb4**. The roles are then assigned to the test user as required for the ACL verification process.

The second planned activity is to create the **u_institution_details** table under System Definition → Tables. The table is planned with Student Roll Number, Student Name, Faculty Name, Branch, Email, Phone Number, and Description fields. Multiple records with **ECE, EEE, and CSE** branch values are then created for testing.

The third planned activity is to open Access Control (ACL), elevate the **security_admin** role, and configure the Read ACL. The Read ACL requires **bb1**, uses the data condition **Branch is EEE**, and

includes the script to provide administrator access and evaluate the required role. Separate Create, Write, and Delete ACLs are then planned with **bb2, bb3, and bb4** respectively.

The final planned checks include impersonating the EEE user and users without the required roles, opening the Institution Details list, and verifying which records and operations are available. The administrator account is also tested to confirm full access to all records regardless of branch.
